Application Idea Summary

This application is a forum-style Q&A platform designed to support programming discussions and collaborative problem solving. Users can create posts to ask coding-related questions, respond to other users' queries, and evaluate responses through an upvote and downvote system based on their usefulness. They can also report inappropriate or low-quality content, and original posters are able to mark a response as the accepted solution.

The platform includes a reputation system that rewards users for meaningful contributions, encouraging engagement and high-quality responses. Overall, the system is designed to simulate a real-world developer Q&A environment similar to Stack Overflow, where knowledge sharing and community participation drive the quality of content.

Implemented User Stories

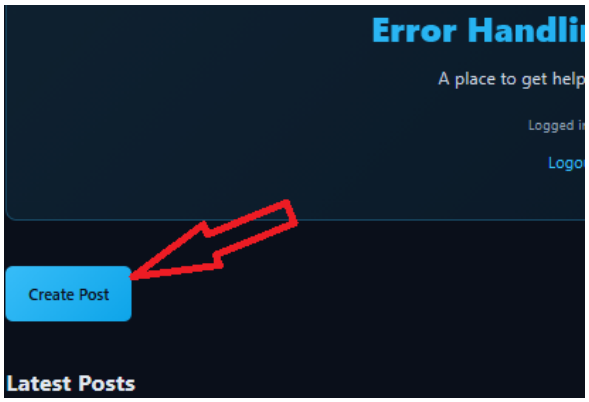
Posting & Content

Create Help Post

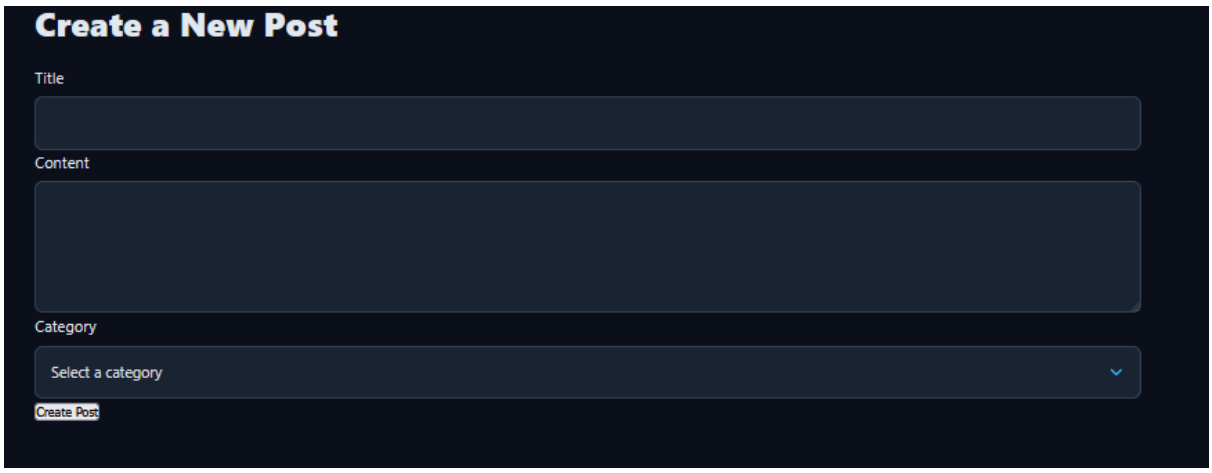
As a user, I want to create a help request so that I can receive assistance with a coding problem.

Screenshot:

1.



2.



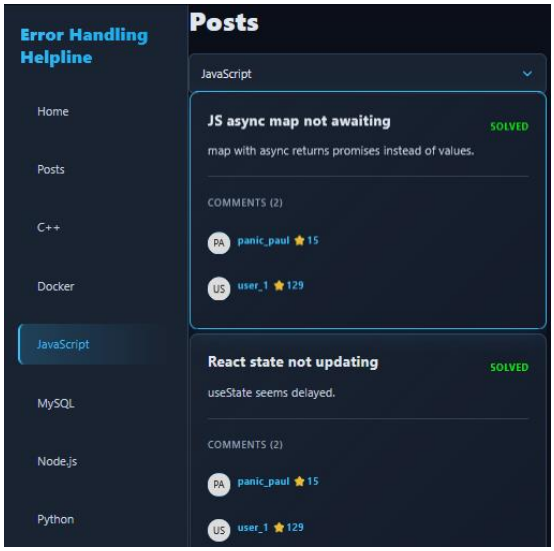
Confirmation:

User can create a new post using the create post button, which will add a new post entry into the database.

View Posts

As a user, I want to browse help posts so that I can find problems I can assist with.

Screenshot:



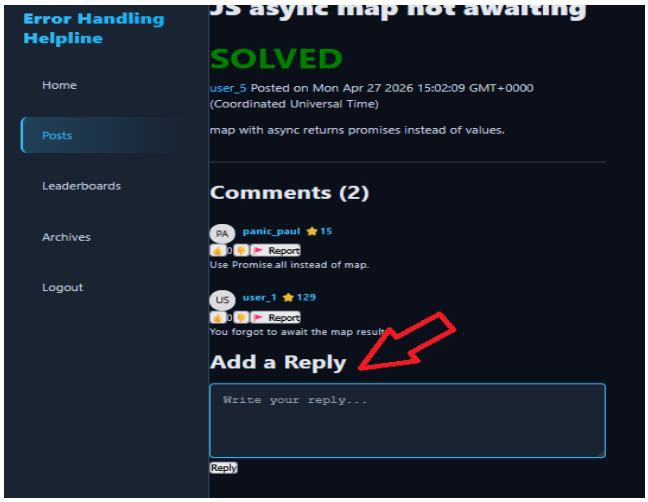
Confirmation:

User can browse different categories of posts or view all posts to the website.

Answer a Post

As a user, I want to respond to a help request so that I can assist another student.

Screenshot:



Confirmation:

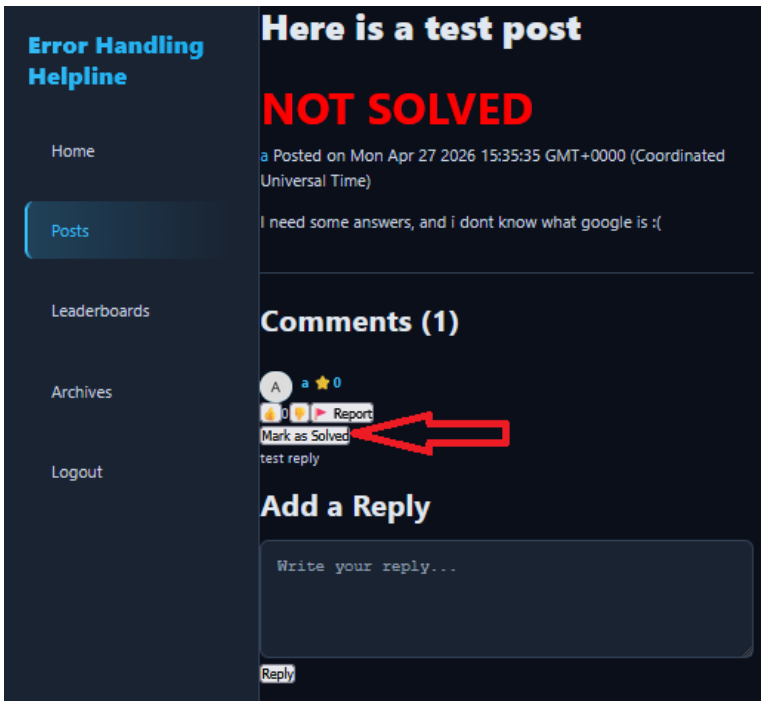
As long as the user is logged in, they can reply to any post they want and assist in helping solve the problem.

Solution System

Mark Answer as Solved (Accepted Answer)

As the original poster, I want to mark an answer as solved so that helpful responses are recognised.

Screenshot:



Confirmation:

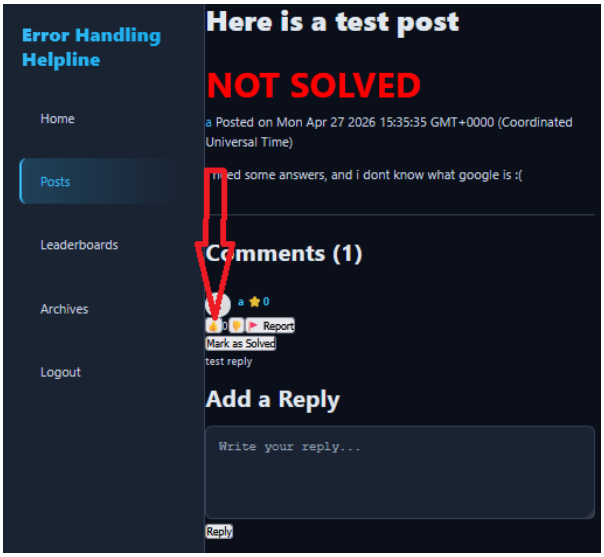
If the user is the post owner, they can mark a reply as the correct response.

Reputation System (Gamification)

Earn Reputation

As a contributor, I want to earn reputation points when my answers are marked as helpful so that my contributions are recognised.

Screenshot:



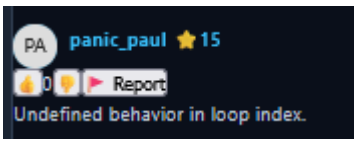
Confirmation:

If the user is logged in, they can upvote or downvote responses which will either add or remove reputation from the response's owner.

View Reputation

As a user, I want to see my reputation score and role title so that I can understand my standing in the community.

Screenshot:



Confirmation:

User can see their reputation from their profile or if they comment on a post it will display next to their username.

Automatic Role Progression

As a contributor, I want my role to update automatically based on reputation so that progression is visible and meaningful.

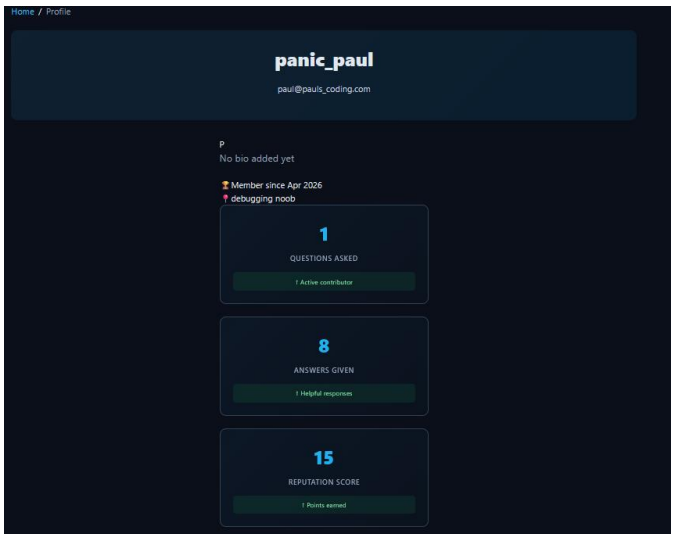
Confirmation:

Users reputation is updated inside the upvote/downvote function, so that it will always be updated on any reputation change.

View Other Users' Reputation

As a user, I want to see reputation and role titles next to usernames so that I can identify experienced contributors.

Screenshot:



Confirmation:

Users can go into other users profiles and see reputation and role titles.

Moderation Features

Report Content

As a user, I want to report inappropriate or low-quality content so that the community remains safe

Screenshot:

Confirmation:

The system allows users to report responses that are deemed inappropriate, low quality, or disrespectful which helps maintain a community environment.
